

2017 Drinking Water Quality Report Update

August 2, 2018
BPU Meeting

OUR FUTURE IN EVERY DRÖP

Compliance with the Safe Drinking Water Act (SDWA)

Federal Rules – Public drinking water quality:

- Total Coliform Rule
- Disinfectants/Disinfection By-Products Rule
- Lead and Copper Rule
- Groundwater Rule

State Regulations - Cross Connection Control

Annual Water Quality Report provides:

- Water system information
- Testing Information
- Definitions
- How to Read Section
- Water Quality Results
- Fire Update
- Exceedances

⁽¹⁾ Turbidity: **Annual average** is the mean of the monthly average values, weighted by hours of pump operation each month.

Range refers to the minimum and maximum Turbidity readings recorded by the online Turbidimeters at each site.

⁽²⁾ Total Trihalomethanes: 40 CFR Section 141.12 - Is the sum of the concentrations of Bromodichloromethane, Dibromochloromethane, Bromoform, and Chloroform.

⁽³⁾ MCL: Secondary Standard.

⁽⁴⁾ Methyl tert-butyl ether (MTBE) is listed in both the Primary (Organic Chemicals - VOCs) and Secondary standards.

Santa Rosa's drinking water meets or exceeds all State and Federal drinking water health standards. Your water is tested weekly and the water system is carefully managed to be dependable and safe.

Note: Listed in the table above are substances detected in the City's drinking water. A full listing of sample results is on our website.

1 The Water Agency has 9 different groundwater sources that can be blended together. The range detected and the reporting value are the high, low, average and weighted average of the 9 sources.

2 Santa Rosa water data includes sampling taken in the distribution system and from source water wells.

Our two drinking water wells are sampled separately. The Manganese reporting value is after treatment.

3 Fluoridation to fight tooth decay has not been implemented in Santa Rosa. The optimal dose of fluoride in water to fight tooth decay is 0.7 ppm.

4 Benzene was not present in regulatory quarterly source water sampling, but was found in post-fire investigative sampling related to the introduction of melted plastics in an isolated area of

Fontainebleau. "Discharge from plastics, dyes and nylon factories; leaching from gas storage tanks and landfills" is EPA recommended language that does not apply to our unique contamination.

5 Radon is a radioactive gas that can get into indoor air when released from tap water from showering or running a faucet. Radon entering the home through tap water is a very small source of radon in indoor air. EPA is proposing to require

community water suppliers to provide water with radon levels no higher than 4,000 pCi/L, which contributes about 0.4 pCi/L of radon to the air in your home. More information is available at EPA website: <http://www.epa.gov/radon/radon.html>. The State allows us to monitor for some contaminants less than once per year. Our radon data for Santa Rosa's source, though representative, was sampled in 2009.
