Executive Summary

The proposed project is a 114-room Residence Inn hotel to be located on Round Barn Circle in the City of Santa Rosa. Based on standard trip generation rates it would be expected to generate an average of 931 trips daily, including 68 during the weekday p.m. peak hour. On weekends, 99 trips would be expected during the peak hour.

Six intersections in the vicinity of the project were evaluated for safety and operational concerns. Five of the six are currently operating acceptably during both peaks studied, and had collisions at a rate that is less than the Statewide average for that type of intersection.

Mendocino Avenue/Fountaingrove Parkway currently operates at LOS E during the evening peak hour and has an above-average collision rate. The congestion associated with LOS E operation as well as the skewed alignment of the intersection and merge lanes likely contribute to the above-average rate of collisions, though it is noted that the actual rate is not substantially higher than the average so no remedial action appears necessary. Because LOS E is considered unacceptable under the standards applied, operation of Mendocino Avenue was evaluated to determine if the City's standard is met. It was determined that Mendocino Avenue is operating at LOS D, so the single intersection at LOS E is considered acceptable. Upon adding project trips to existing volumes, no substantial changes to operation are expected, resulting in less-than-significant impacts. Under Future volumes, the intersection of Mendocino Avenue/ Fountaingrove Parkway is expected to continue operating unacceptably, but because the arterial segment is expected to operate at LOS D, this is considered acceptable. Likewise, with project trips added operation of the arterial segment is acceptable, making the impact less-than-significant.

Facilities for alternative modes are adequate, though it is recommended that secure parking for 12 bicycles be provided at the site. Parking as proposed for passenger vehicles is adequate to meet the requirements of the City's code.

Introduction

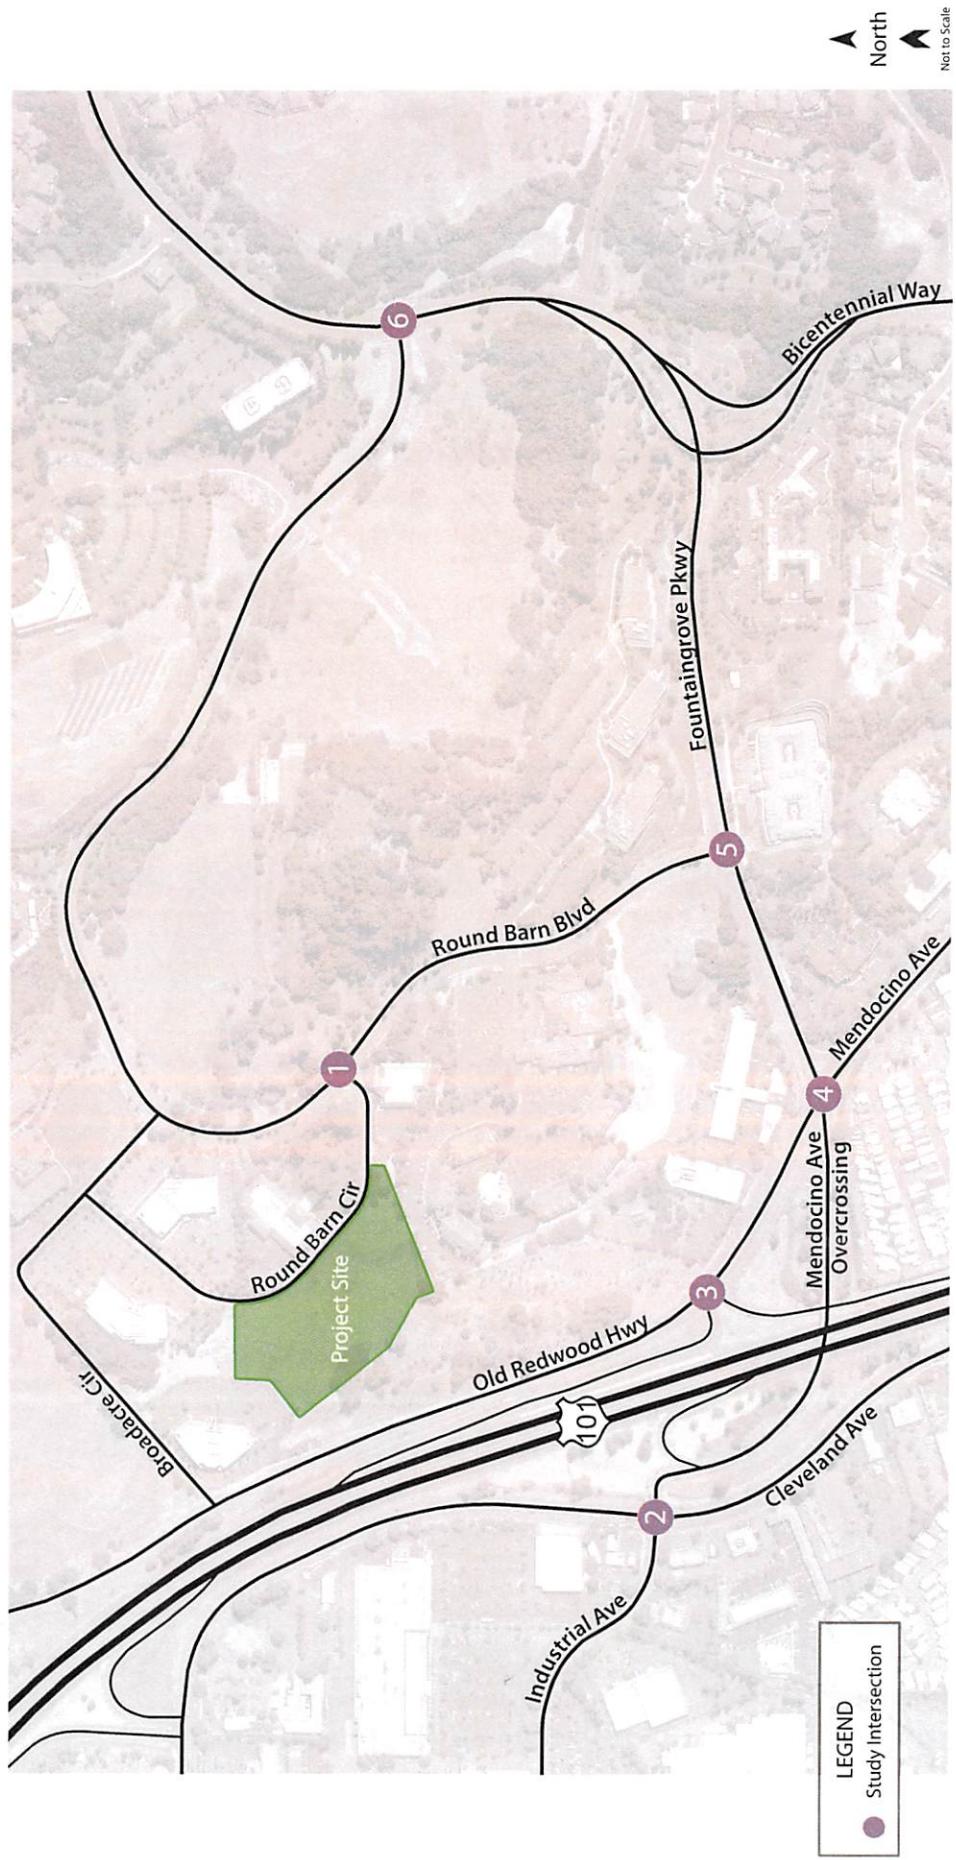

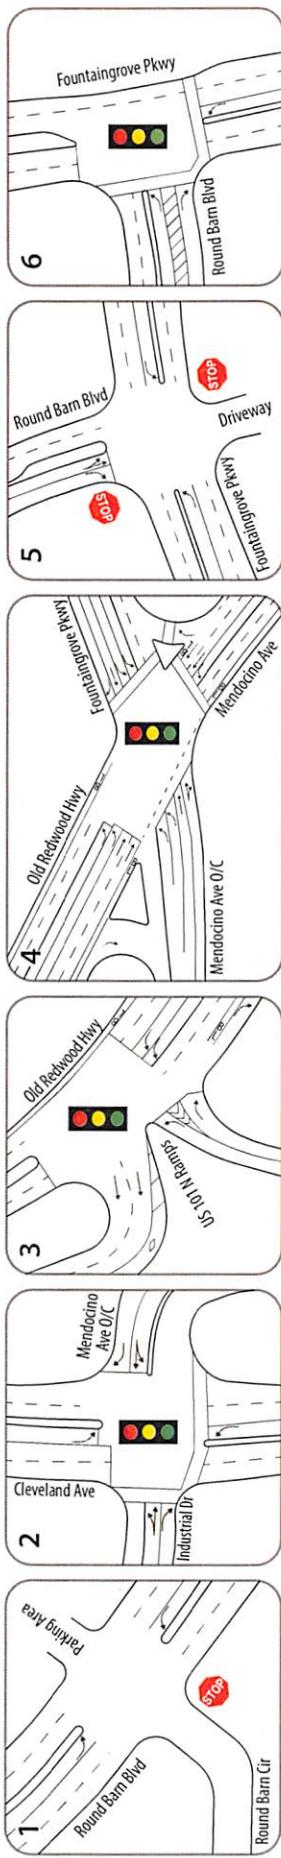

This report presents an analysis of the potential traffic impacts that would be associated with development of a proposed hotel project on the west of Round Barn Circle in the City of Santa Rosa. The traffic study was completed in accordance with the criteria established by the City of Santa Rosa, and is consistent with standard traffic engineering techniques.

Prelude

The purpose of a traffic impact study is to provide City staff and policy makers with data that they can use to make an informed decision regarding the potential traffic impacts of a proposed project, and any associated improvements that would be required in order to mitigate these impacts to a level of insignificance as defined by the City's General Plan or other policies. Vehicular traffic impacts are typically evaluated by determining the number of new trips that the proposed use would be expected to generate, distributing these trips to the surrounding street system based on existing travel patterns or anticipated travel patterns specific to the proposed project, then analyzing the impact the new traffic would be expected to have on critical intersections or roadway segments. Impacts relative to access for pedestrians, bicyclists, and to transit are also addressed.

Project Profile

The proposed project includes the construction of a Residence Inn with 114 rooms to be located on west side of Round Barn Circle. The project site would be accessed via two new driveways on Round Barn Circle. The project location is shown in Figure 1.

Transportation Setting

Operational Analysis

Study Area and Periods

The study area was coordinated with City staff and consists of the following intersections:

1. Round Barn Circle/Round Barn Boulevard
2. Cleveland Avenue/Industrial Drive
3. Mendocino Avenue/US 101 North Ramps
4. Mendocino Avenue/Fountaingrove Parkway
5. Round Barn Boulevard/Fountaingrove Parkway (lower)
6. Round Barn Boulevard/Fountaingrove Parkway (upper)

Operating conditions during the weekday p.m. and weekend midday peak periods were evaluated to capture the highest potential impacts for the proposed project as well as the highest volumes on the local transportation network. The weekday p.m. peak hour occurs between 4:00 and 6:00 p.m. and typically reflects the highest level of congestion during the homeward bound commute. The peak period evaluated for weekends was 11:30 a.m. to 1:30 p.m.

Study Intersections

Round Barn Boulevard/Round Barn Circle is an unsignalized tee intersection with the terminating Round Barn Circle approach stop-controlled.

Cleveland Avenue/Industrial Drive is a signalized four-legged intersection. The northbound and southbound Cleveland Avenue approaches have protected left-turn phasing. The eastbound Industrial Drive and westbound Mendocino Avenue Overcrossing approaches are split phased with right-turn overlap phasing. The intersection has marked crosswalks on the south and west legs.

Mendocino Avenue/US 101 North Ramps is a signalized tee intersection. The northbound Mendocino Avenue approach has protected left-turn phasing. The off-ramp from US 101 North has a right-turn overlap phase.

Mendocino Avenue/Fountaingrove Parkway is a skewed signalized four-legged intersection. All approaches have protected left-turn phasing, and the westbound Fountaingrove Parkway approach has a right-turn overlap phase. The northbound and southbound Mendocino Avenue approaches have channelized right-turn lanes. Crosswalks are provided on the south and east legs.

Round Barn Boulevard/Fountaingrove Parkway (lower) is an unsignalized tee intersection that is stop-controlled at the southbound approach and includes a marked crosswalk on the south leg.

Round Barn Boulevard/Fountaingrove Parkway (upper) is a signalized tee intersection with crosswalks on the north and west legs. There is protected left-turn phasing for the movement from Fountaingrove Parkway.

Collision History

The collision history for the study area was reviewed to determine any trends or patterns that may indicate a safety issue. Collision rates were calculated based on records available from the California Highway Patrol as published

in their Statewide Integrated Traffic Records System (SWITRS) reports. The most current five-year period available is January 1, 2012 through December 31, 2016.

As presented in Table 1, the calculated collision rates for the study intersections were compared to average collision rates for similar facilities statewide, as indicated in *2014 Collision Data on California State Highways*, California Department of Transportation (Caltrans). Calculated collision rates for the study intersections were lower than the statewide average at five of the six study intersections. Because there is no way to differentiate between the crashes that occurred at the upper versus lower intersections of Round Barn Boulevard and Fountaingrove Parkway, the crashes were split between the two locations, but even if two-thirds of the crashes were assigned to one of the two intersections instead of half, the resulting rate would be equal to the statewide average, so the conclusion that there is not a safety concern would remain the same.

Table 1 – Collision Rates at the Study Intersections

Study Intersection	Number of Collisions (2012-2016)	Calculated Collision Rate (c/mve)	Statewide Average Collision Rate (c/mve)
1. Round Barn Blvd/Round Barn Cir	1	0.15	0.18
2. Cleveland Ave/Industrial Dr	11	0.21	0.27
3. Mendocino Ave/US 101 North Ramps	14	0.26	0.27
4. Mendocino Ave/Fountaingrove Pkwy	25	0.32	0.27
5. Round Barn Blvd/Fountaingrove Pkwy (lower)	4	0.14	0.21
6. Round Barn Blvd/Fountaingrove Pkwy (upper)	4	0.14	0.21

Note: c/mve = collisions per million vehicles entering; **bold** text = collision rate is higher than the statewide average

At the one intersection that had an above average rate, of the 25 reported collisions at Mendocino Avenue/Fountaingrove Parkway, 15 involved two vehicles traveling in the same direction and either hitting in a sideswipe or rear-end crash. These collisions generally resulted from unsafe speed, and are typical of conditions at a congested intersection. Given that the rate is only marginally above average, remedial action does not appear to be warranted.

The collision rate calculations are provided in Appendix A.

Alternative Modes

Pedestrian Facilities

Pedestrian facilities include sidewalks, crosswalks, and pedestrian signal phases, curb ramps, curb extensions, and various streetscape amenities such as lighting, benches, etc. In general, a network of sidewalks, crosswalks, pedestrian signals, and curb ramps provide access for pedestrians within the vicinity of the proposed project site. Continuous sidewalk is provided on Round Barn Boulevard both along the project frontage as well as north and south of the project site. Similarly, sidewalks are provided on Bicentennial Way along the project frontage and extend east and west beyond the project limits. Marked pedestrian crossings are provided at each study intersection.

Bicycle Facilities

The *Highway Design Manual*, Caltrans, 2012, classifies bikeways into three categories used by the City:

- **Class I Multi-Use Path** – a completely separated right-of-way for the exclusive use of bicycles and pedestrians with cross flows of motorized traffic minimized.
- **Class II Bike Lane** – a striped and signed lane for one-way bike travel on a street or highway.
- **Class III Bike Route** – signing only for shared use with motor vehicles within the same travel lane on a street or highway.

In the project area, Class II bike lanes are provided on Mendocino Avenue and extend from College Avenue past the City Limits to Mark West Springs Road. A Class I bike path is provided on Fountaingrove Parkway from Mendocino Avenue to Parker Hill Drive. Class II bike lanes exist on a short segment of Cleveland Avenue and are planned to extend from Hopper Avenue to West 9th Street. Table 2 summarizes the existing and planned bicycle facilities in the project vicinity.

Table 2 – Bicycle Facility Summary

Status Facility	Class	Length (miles)	Begin Point	End Point
Existing				
Fountaingrove Pkwy	I	4.16	Mendocino Ave	Parker Hill Dr
Mendocino Ave	II	2.26	College Ave	Mark West Springs Rd
Cleveland Ave	II	0.70	North of Edwards Ave	Ridgeway Ave
Proposed				
Cleveland Ave	II	1.57	Hopper Ave	North of Edwards Ave
Cleveland Ave	II	0.50	Ridgeway Ave	West 9 th St

Source: *Santa Rosa Bicycle and Pedestrian Master Plan*, City of Santa Rosa, 2014

Transit Facilities

Santa Rosa CityBus (SRCT) Routes 10 provides transit from the study area to the regional transfer point at Coddington Mall. The nearest bus stop is located on Round Barn Boulevard about one-quarter mile east of the project. Route 10 operates Monday through Friday with approximately thirty-minute headways from 6:15 a.m. to 7:15 p.m. On weekends, service is provided hourly from 7:45 a.m. to 4:45 p.m.

Two bicycles can be carried on most SRCT buses. Bike rack space is on a first come, first served basis. Additional bicycles are allowed on SRCT buses at the discretion of the driver.

Dial-a-ride, also known as paratransit, or door-to-door service, is available for those who are unable to independently use the transit system due to a physical or mental disability. Sonoma County Paratransit is designed to serve the needs of individuals with disabilities within Santa Rosa and the greater Santa Rosa area.

Capacity Analysis

Intersection Level of Service Methodologies

Level of Service (LOS) is used to rank traffic operation on various types of facilities based on traffic volumes and roadway capacity using a series of letter designations ranging from A to F. Generally, Level of Service A represents free flow conditions and Level of Service F represents forced flow or breakdown conditions. A unit of measure that indicates a level of delay generally accompanies the LOS designation.

The study intersections were analyzed using the signalized methodology published in the *Highway Capacity Manual* (HCM), Transportation Research Board, 2010. This source contains methodologies for various types of intersection control, all of which are related to a measurement of delay in average number of seconds per vehicle. The signalized methodology is based on factors including traffic volumes, green time for each movement, phasing, whether or not the signals are coordinated, truck traffic, and pedestrian activity. Average stopped delay per vehicle in seconds is used as the basis for evaluation in this LOS methodology. For purposes of this study, delays were calculated using signal timing provided by the City. The intersection of Mendocino Avenue/Bicentennial Way has a left-turn phase that both leads and lags; this additional phase results in non-standard phasing and had to be analyzed using HCM 2000.

The ranges of delay associated with the various levels of service are indicated in Table 3.

Table 3 – Signalized Intersection Level of Service Criteria

LOS A	Delay of 0 to 10 seconds. Most vehicles arrive during the green phase, so do not stop at all.
LOS B	Delay of 10 to 20 seconds. More vehicles stop than with LOS A, but many drivers still do not have to stop.
LOS C	Delay of 20 to 35 seconds. The number of vehicles stopping is significant, although many still pass through without stopping.
LOS D	Delay of 35 to 55 seconds. The influence of congestion is noticeable, and most vehicles have to stop.
LOS E	Delay of 55 to 80 seconds. Most, if not all, vehicles must stop and drivers consider the delay excessive.
LOS F	Delay of more than 80 seconds. Vehicles may wait through more than one cycle to clear the intersection.

Reference: *Highway Capacity Manual*, Transportation Research Board, 2010

Arterial Segment Level of Service Methodology

The roadway segment Level of Service methodology found in Chapter 15, "Urban and Suburban Arterials," of the HCM is the basis of the analysis performed for the study road segment. This method does not address the capacity of a facility, but rather determines a Level of Service based on average through-vehicle travel speed. In essence, congestion occurs as traffic volumes increase, and the overall travel speed is reduced due to increased delay. Therefore, the slower the average travel speed, the lower the Level of Service.

As described in the HCM, there are various arterial classifications with different free flow travel speeds and, hence, different Level of Service speeds. The relationship between arterial classification and Level of Service speed is presented in Table 4.

Table 4 – Arterial Level of Service Criteria

Arterial Class	I	II	III	IV
Range of Free Flow Speeds (mph)	55 to 45	45 to 35	35 to 30	35 to 25
Typical Free Flow Speed (mph)	50	40	35	30
Level of Service	Average Travel Speed (mph)			
A	> 42	> 35	> 30	> 25
B	> 34	> 28	> 24	> 19
C	> 27	> 22	> 18	> 13
D	> 21	> 17	> 14	> 9
E	> 16	> 13	> 10	> 7
F	≤ 16	≤ 13	≤ 10	≤ 7

Traffic Operation Standards

The City of Santa Rosa's adopted Level of Service (LOS) Standard is contained in *Santa Rosa General Plan 2035*. Standard TD-1 states that the City will try to maintain a Level of Service (LOS) D or better along all major corridors. Exceptions to meeting this standard are allowed where attainment would result in significant environmental degradation; where topography or environmental impacts make the improvement impossible; or where attainment would ensure loss of an area's unique character.

While a corridor level of service is applied by the City in its analysis of the entire City as part of the environmental documentation supporting the General Plan, this type of analysis only provides relevant data when performed on a much longer segment than the one included as the study area for the project. Therefore, although the City's standard does not specify criteria for intersections, for the purposes of this study a minimum operation of LOS D for the overall operation of signalized intersections was applied.

If the service level of an individual intersection fell below LOS D, the corridor was evaluated to determine if the City's operational standard is met.

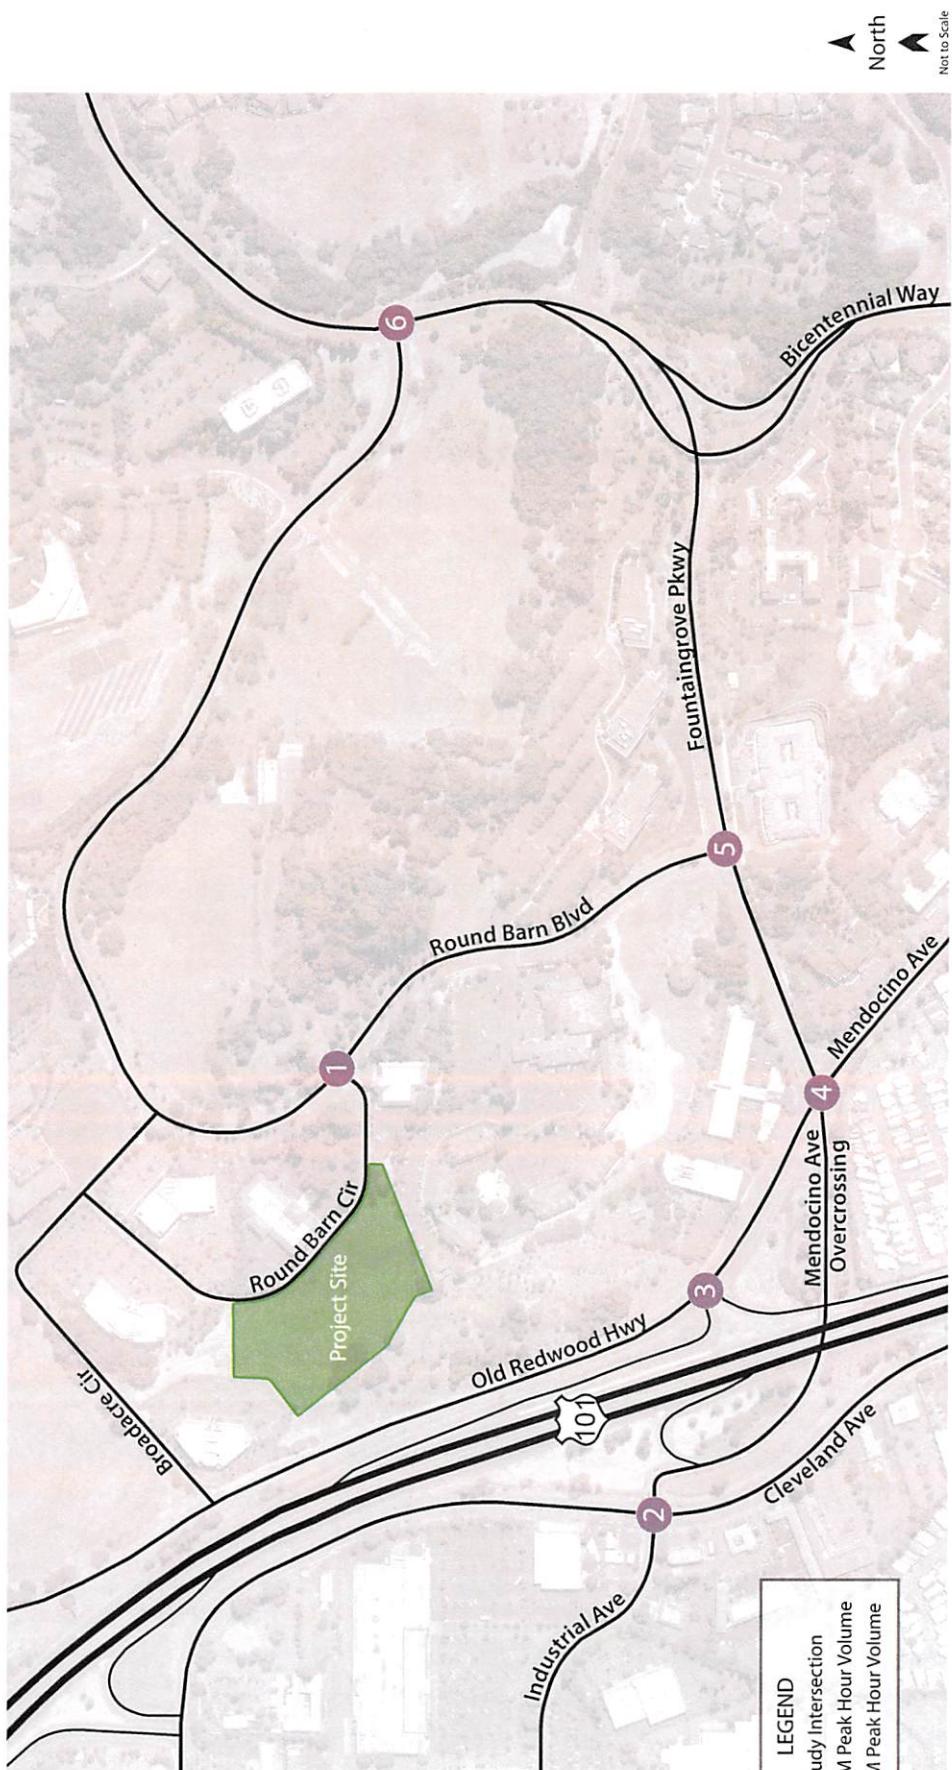

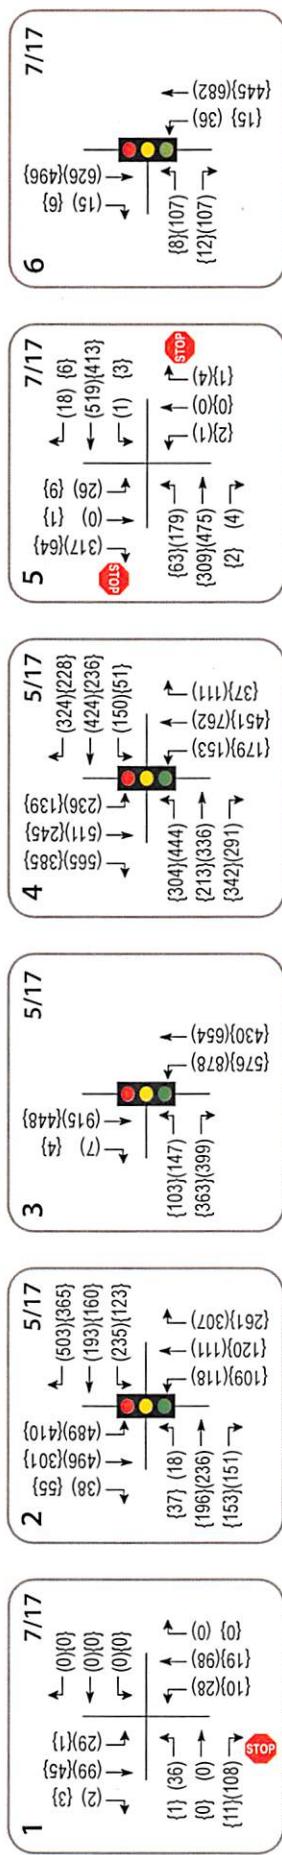

While two of the study intersections include freeway ramps, the City's operational standard was applied, as is typically the case for locations that are crucial to a local jurisdiction's circulation system.

Existing Conditions

The Existing Conditions scenario provides an evaluation of current operation based on existing traffic volumes during the weekday p.m. and weekend midday peak periods. This condition does not include project-generated traffic volumes.

Intersection Levels of Service

Under existing conditions, five of the six study intersections are operating at an acceptable level of service; Mendocino Avenue/Fountaingrove Parkway is currently operating unacceptably at LOS E during the weekday p.m. peak hour. The existing traffic volumes are shown in Figure 2. A summary of the intersection level of service calculations is contained in Table 5, and copies of the Level of Service calculations are provided in Appendix B.

Residence Inn Traffic Impact Study Final Report

Table 5 – Existing Peak Hour Intersection Levels of Service

Study Intersection <i>Approach</i>	Weekday PM Peak		Saturday Peak	
	Delay	LOS	Delay	LOS
1. Round Barn Blvd/Round Barn Cir <i>Eastbound (Round Barn) Approach</i>	4.6	A	2.0	A
	9.9	A	8.5	A
2. Cleveland Ave/Industrial Dr	31.9	C	22.5	C
3. Mendocino Ave/US 101 North Ramps	23.5	C	22.4	C
4. Mendocino Ave/Fountaingrove Pkwy	60.1	E	36.1	D
5. Round Barn Blvd/Fountaingrove Pkwy (lower) <i>Southbound (Round Barn) Approach</i>	4.6	A	1.6	A
	15.5	C	10.9	B
6. Round Barn Blvd/Fountaingrove Pkwy (upper)	7.9	A	2.5	A

Notes: Delay is measured in average seconds per vehicle; LOS = Level of Service; Results for minor approaches to two-way stop-controlled intersections are indicated in *italics*; **Bold** text indicates unacceptable operation

Roadway Levels of Service

Because the intersection of Mendocino Avenue/Fountaingrove Parkway is currently operating at LOS E during the weekday p.m. peak period, and therefore below the operational standard of LOS D, further analysis was performed to determine the arterial service level on Mendocino Avenue. The SIMTRAFFIC application of Synchro was used to determine the average travel speed on Mendocino Avenue between the on-ramp to US 101 North and Administration Drive-Chanate Road. This analysis takes into account the queued vehicles at the signalized intersections, so the reported speed is an average of both stopped vehicles and moving vehicles in the network. With a free-flow speed of about 40 to 45 mph, Mendocino Avenue was considered a Class II arterial. As shown in Table 6, the average speed in on Mendocino Avenue each direction based on ten simulation runs is 19 mph. For Class II arterials, this represents LOS D operation, which is acceptable under the City's standard.

Table 6 – Existing PM Peak Hour Average Travel Speed on Mendocino Avenue

Northbound		Southbound	
Speed	LOS	Speed	LOS
19	D	18	D

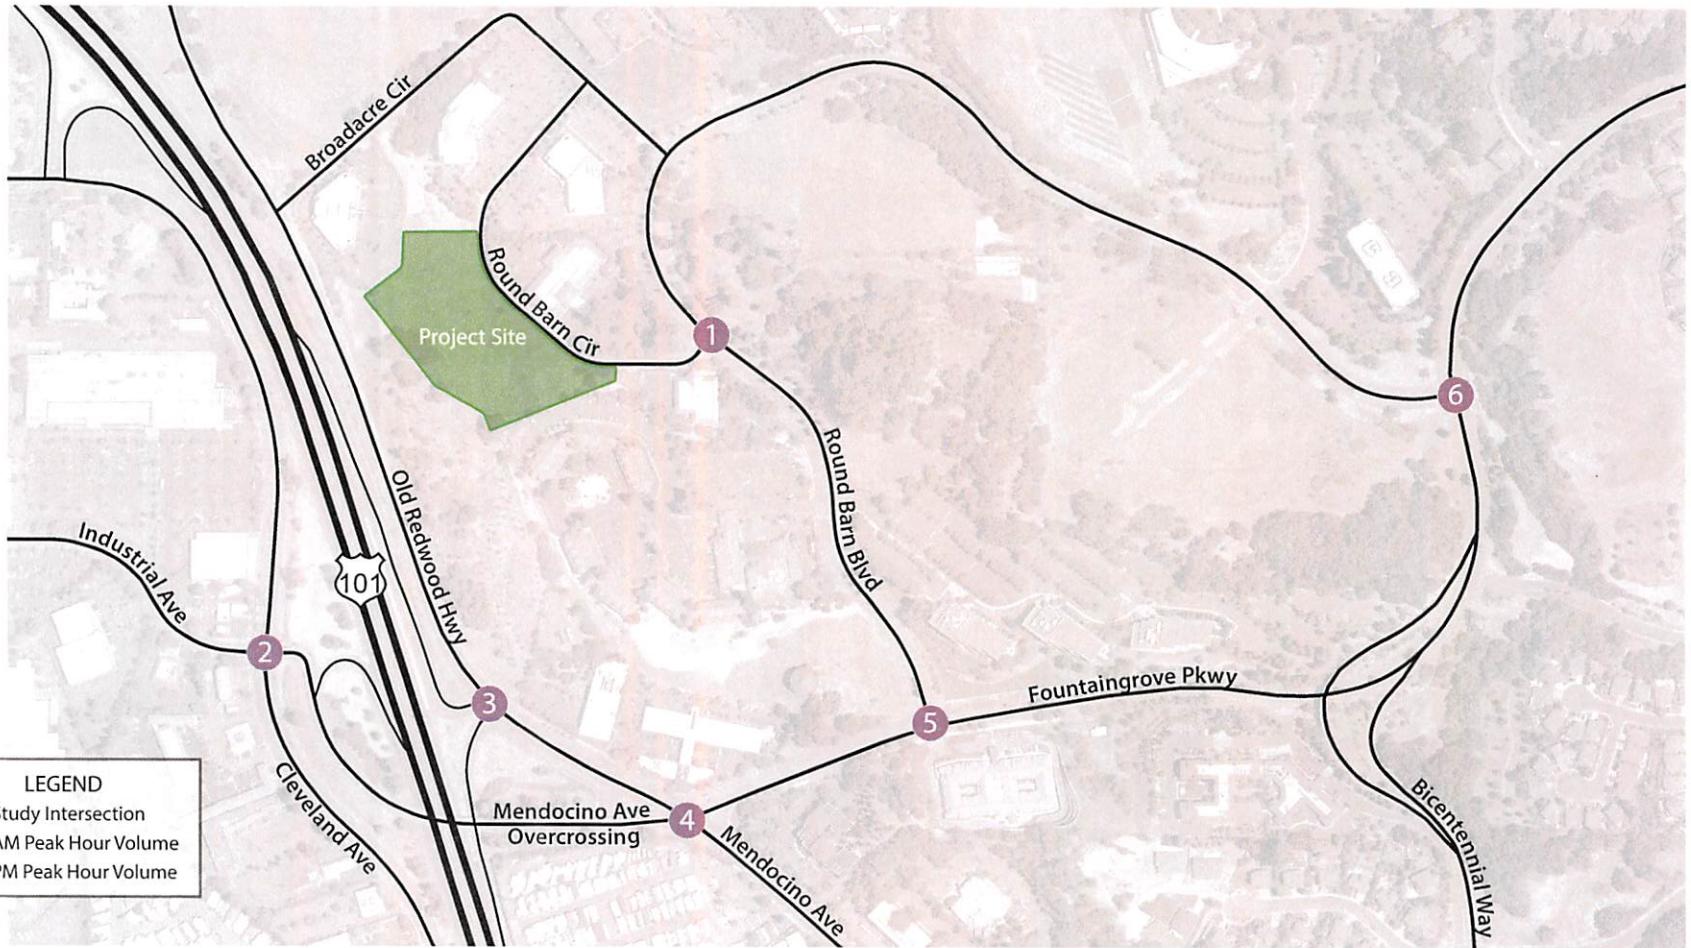

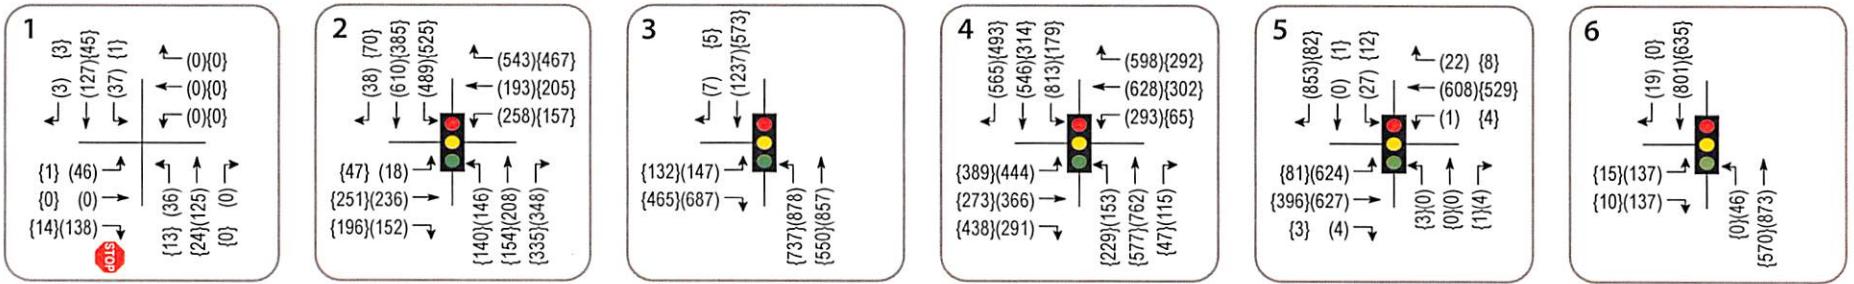

Notes: Speed is reported in miles per hour (mph)

Future Conditions

Segment volumes for the horizon year of 2040 were obtained from the County's gravity demand model and translated to turning movement volumes at each of the study intersections using the "Furness" method. The Furness method is an iterative process that employs existing turning movement data, existing link volumes, and future link volumes to project likely turning future movement volumes at intersections. The City plans to signalize the intersection of Fountaingrove Parkway/Round Barn Boulevard (lower), and this project is included in the City's facilities fee. This improvement was assumed for the analysis of Future conditions.

Intersection Operation

Under the anticipated Future volumes, four of the six study intersections are expected to operate at acceptable levels of service. Future volumes are shown in Figure 3 and operating conditions are summarized in Table 7.

Residence Inn Traffic Impact Study Final Report
Figure 3 – Future Traffic Volumes

Table 7 – Future Peak Hour Intersection Levels of Service

Study Intersection <i>Approach</i>	Weekday PM Peak		Saturday Peak	
	Delay	LOS	Delay	LOS
1. Round Barn Blvd/Round Barn Cir	4.9	A	2.3	A
<i>Eastbound (Round Barn) Approach</i>	10.5	B	8.5	A
2. Cleveland Ave/Industrial Dr	41.4	D	35.7	D
3. Mendocino Ave/US 101 North Ramps	25.9	C	23.0	C
4. Mendocino Ave/Fountaingrove Pkwy	135.8	F	43.4	D
5. Round Barn Blvd/Fountaingrove Pkwy (lower)	35.0	D	9.8	A
6. Round Barn Blvd/Fountaingrove Pkwy (upper)	8.5	A	1.2	A

Notes: Delay is measured in average seconds per vehicle; LOS = Level of Service; Results for minor approaches to two-way stop-controlled intersections are indicated in *italics*; **Bold** text indicates unacceptable operation

Arterial Operation

Because LOS F operation is projected at Mendocino Avenue/Fountaingrove Parkway under future volumes, the operation of the arterial was evaluated. As shown in Table 8, the arterial is operating acceptably during both peak periods; therefore, operation is considered acceptable.

Table 8 – Future PM Peak Hour Average Travel Speed on Mendocino Avenue

Northbound		Southbound	
Speed	LOS	Speed	LOS
17	D	20	D

Notes: Speed is reported in miles per hour (mph)

Project Description

The proposed project is a 114-room hotel to be located on currently vacant lands. Two driveways on Round Barn Circle would provide access to the parking lot. The site plan is shown in Figure 4.

Trip Generation

The anticipated trip generation for the proposed project was estimated using standard rates published by the Institute of Transportation Engineers (ITE) in *Trip Generation Manual*, 9th Edition, 2012. For the proposed use the rates for Hotel (LU #310) was applied to the 114-unit Residence Inn. Based on application of these standard rates, the proposed project is expected to generate an average of 931 net new trips per day, including 68 p.m. peak hour trips and 99 trips during the weekend peak hour. The expected trip generation potential for the proposed project is indicated in Table 9.

Residence Inn Traffic Impact Study Final Report
Figure 4 – Site Plan

Source: DesignCell Architecture 8/17

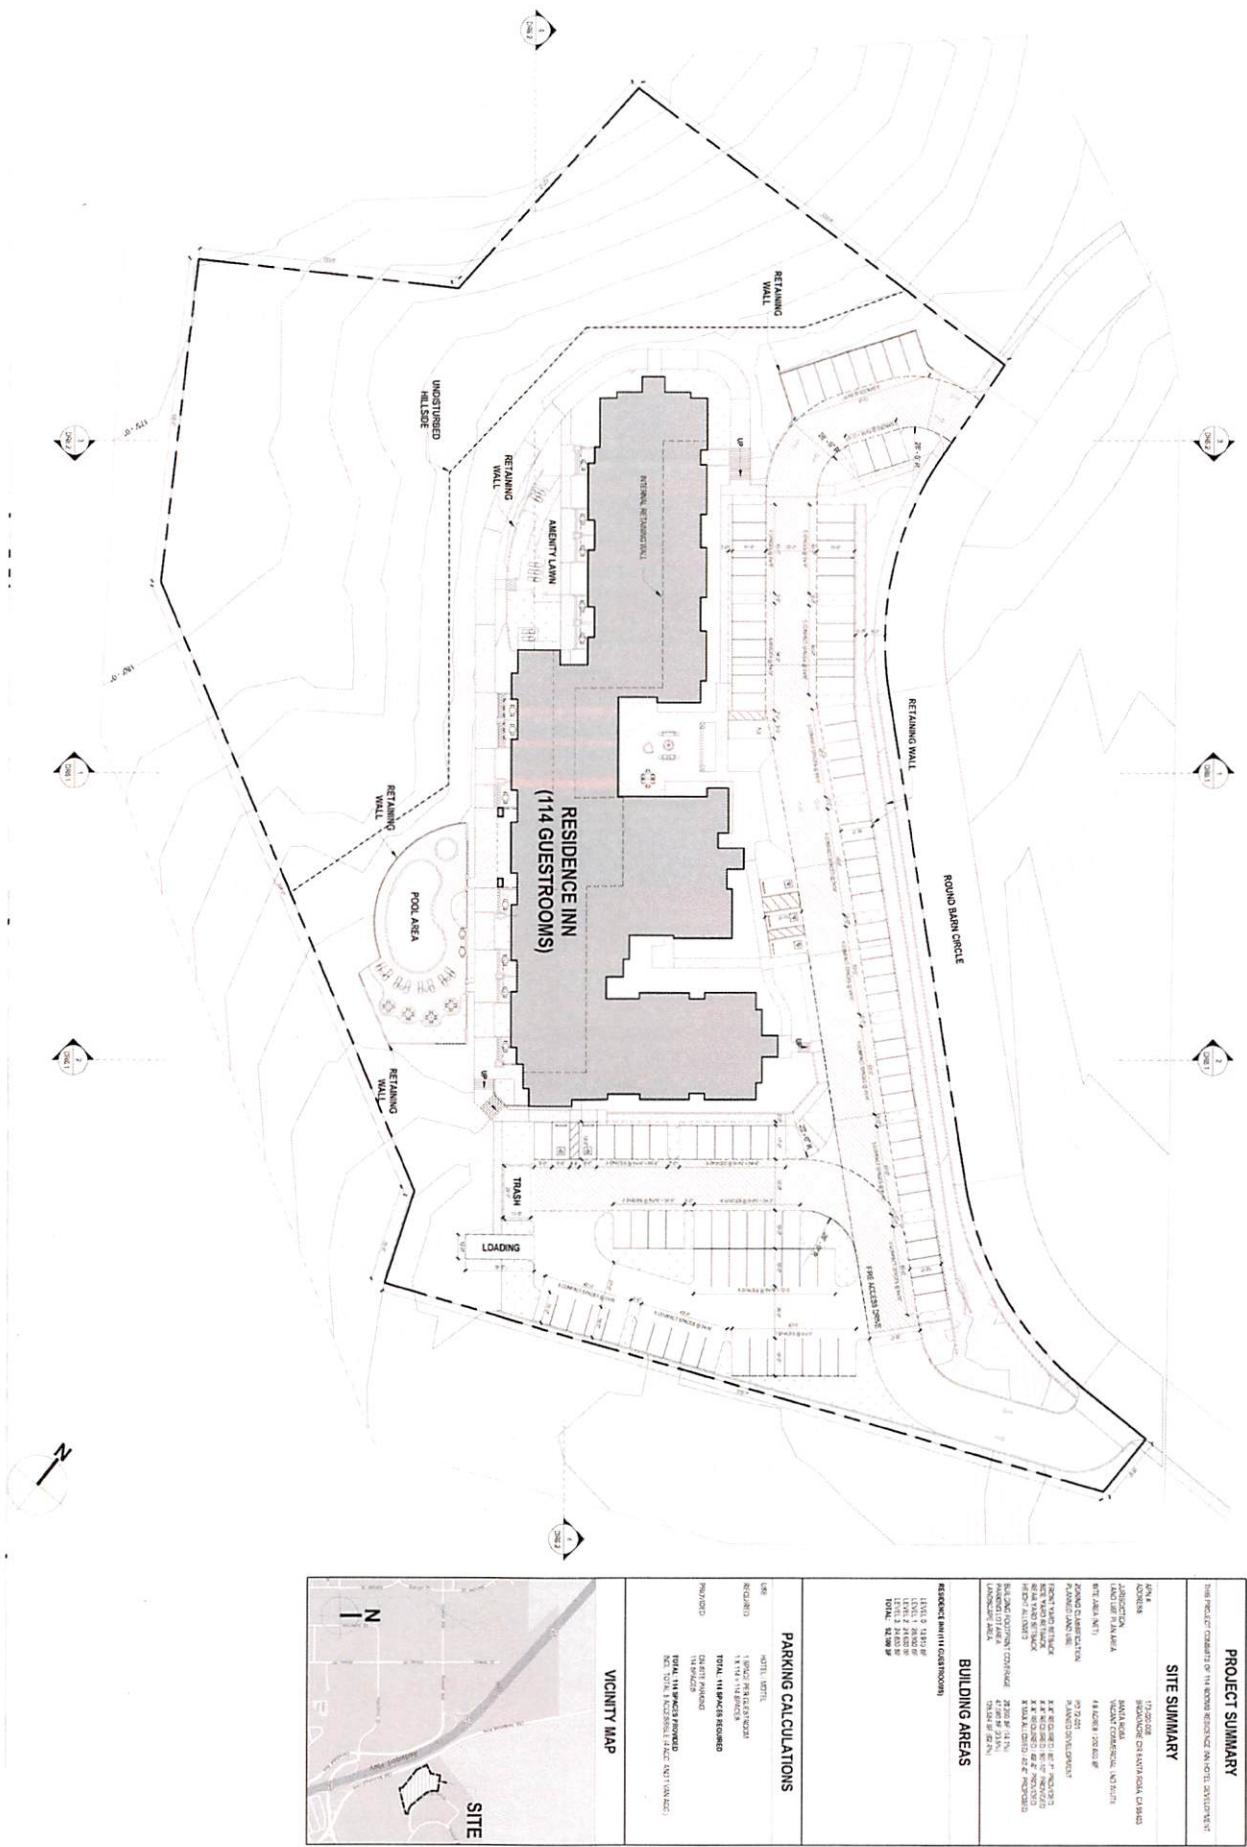

Table 9 – Trip Generation Summary

Land Use	Units	Daily		Weekday PM Peak Hour				Saturday Peak Hour			
		Rate	Trips	Rate	Trips	In	Out	Rate	Trips	In	Out
Hotel	114	8.17	931	0.60	68	35	33	.87	99	50	49

It is noted that the project as evaluated included 115 rooms, or one more outbound trip during each of the two study periods. The analysis is therefore slightly conservative.

Trip Distribution

The pattern used to allocate new project trips to the street network reflects the location at a crossroads as well as the connections to US 101. The applied trip distribution percentages are shown in Table 10.

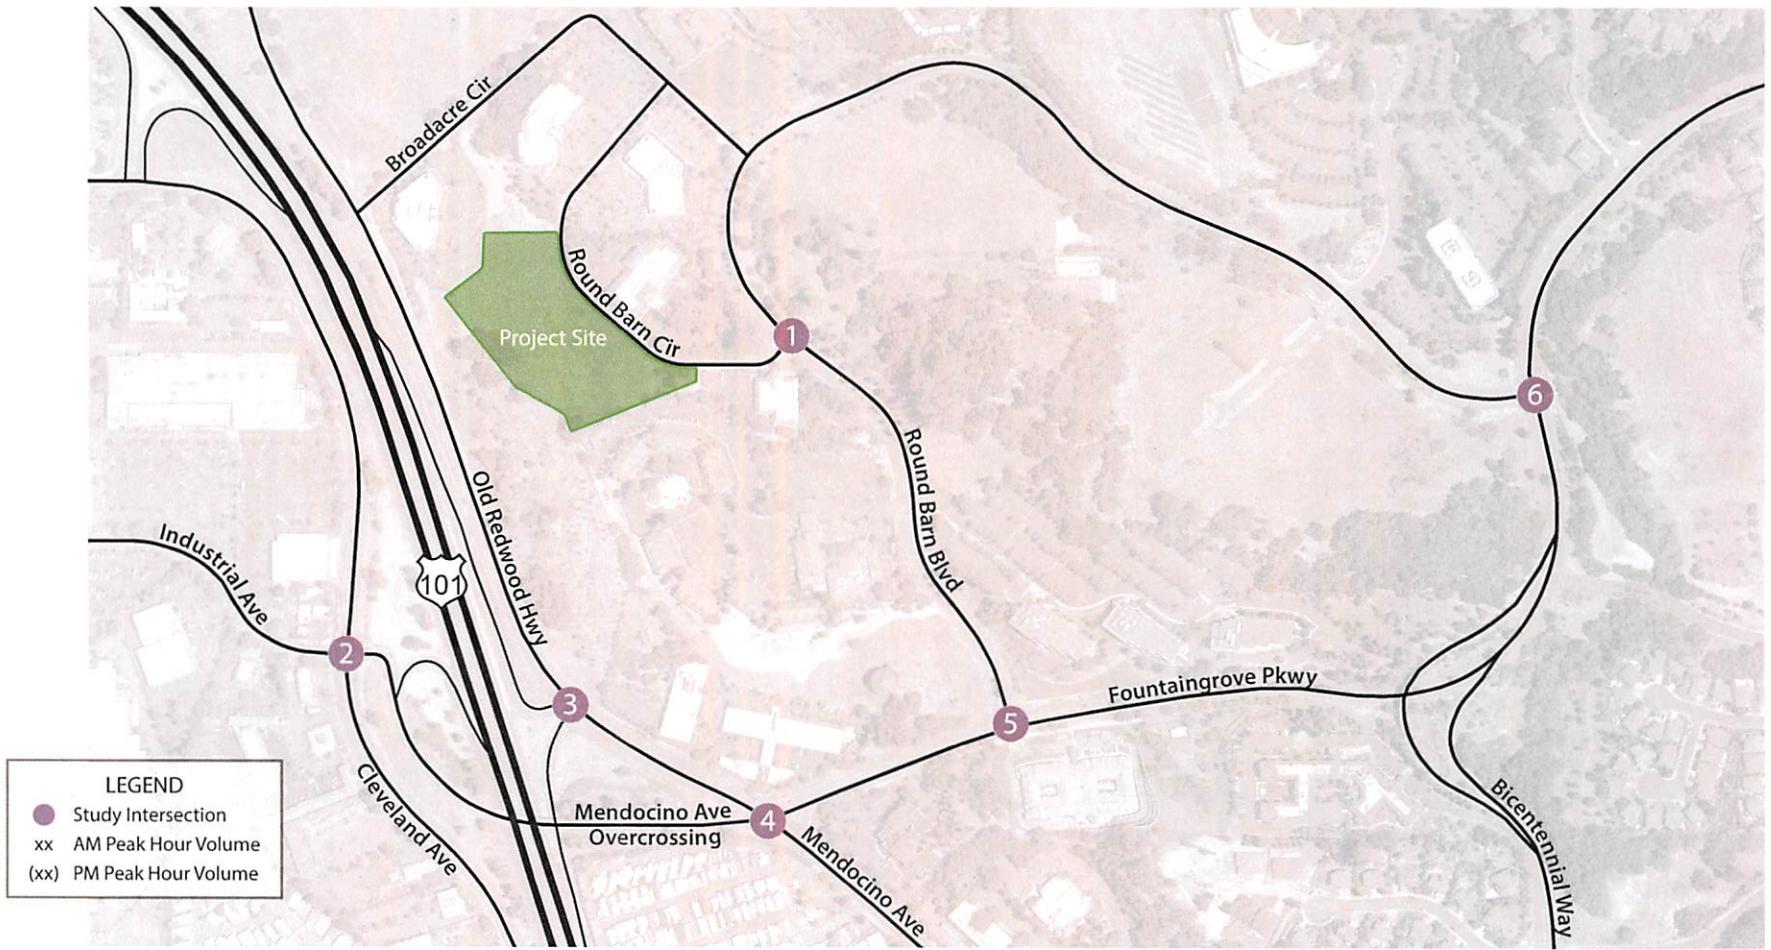

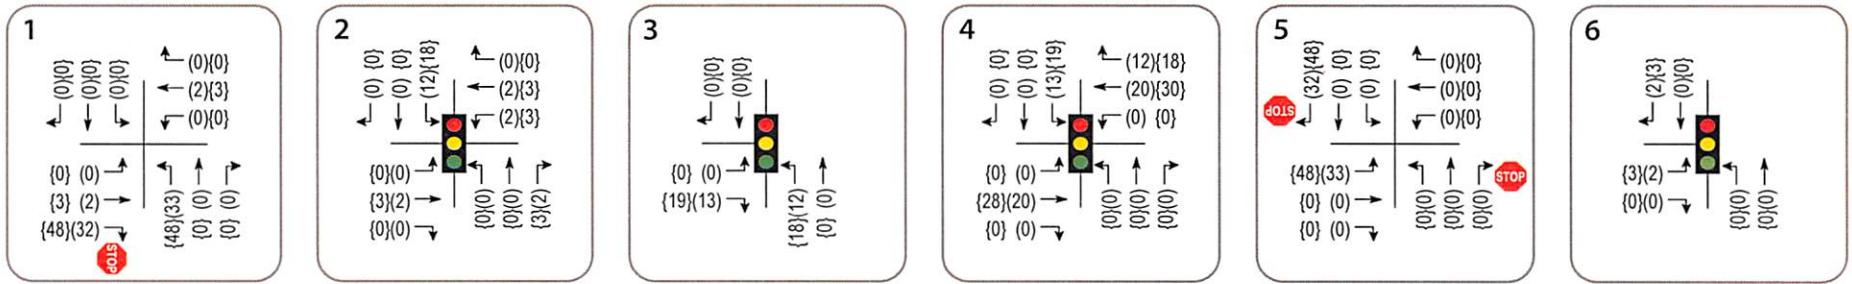

Table 10 – Trip Distribution Assumptions

Route	Percent
To/from the north via US 101	35
To/from the south via US 101	45
To/from the south via Mendocino Ave	5
To/from the south via Cleveland Ave	5
To/from the east via Fountaingrove Pkwy	5
To/from the west via Industrial Drive	5
TOTAL	100

Existing plus Project Conditions

Intersection Operation

Upon the addition of project-related traffic to the Existing volumes, the study intersections are expected to continue operating acceptable levels of service except Mendocino Avenue/Fountaingrove Parkway, which would continue to operate at LOS E. Project traffic volumes are shown in Figure 5, and operating conditions are summarized Table 11.

Residence Inn Traffic Impact Study Final Report
Figure 5 – Project Traffic Volumes

Table 11 – Existing and Existing plus Project Peak Hour Intersection Levels of Service

Study Intersection Approach	Existing Conditions				Existing plus Project			
	Weekday PM Peak		Saturday Peak		Weekday PM Peak		Saturday Peak	
	Delay	LOS	Delay	LOS	Delay	LOS	Delay	LOS
1. Round Barn Blvd/Round Barn Cir <i>Eastbound (Round Barn) Approach</i>	4.6	A	2.0	A	5.4	A	5.3	A
	9.9	A	8.5	A	10.2	B	8.8	A
2. Cleveland Ave/Industrial Dr	31.9	C	22.5	C	33.0	C	23.2	C
3. Mendocino Ave/US 101 North Ramps	23.5	C	22.4	C	23.5	C	22.4	C
4. Mendocino Ave/Fountaingrove Pkwy	60.1	E	36.1	D	63.0	E	37.0	D
5. Round Barn Blvd/Fountaingrove Pkwy (lower) <i>Southbound (Round Barn) Approach</i>	4.6	A	1.6	A	5.2	A	2.4	A
	15.5	C	10.9	B	16.4	C	11.0	B
6. Round Barn Blvd/Fountaingrove Pkwy (upper)	7.9	A	2.5	A	7.9	A	2.6	A

Notes: Delay is measured in average seconds per vehicle; LOS = Level of Service; Results for minor approaches to two-way stop-controlled intersections are indicated in *italics*; **Bold** text indicates unacceptable operation

Finding – The study intersections are expected to continue operating at the same levels of service upon the addition of project-generated traffic. As noted for Existing operation, because Mendocino Avenue/Fountaingrove Parkway is operating at LOS E, operation of the arterial segment was also evaluated.

Arterial Operation

Upon adding project-generated trips to Mendocino Avenue, speeds are expected to remain virtually constant, though a 1-mph increase (or improvement) is projected in the southbound direction. While this result is counter-intuitive, it is noted that because of the random seeding of vehicles for micro-simulation and the stochastic nature of the model, results vary from one run to the next, which is why ten runs were performed. Similarly, the average of ten runs may vary from one set of runs to another for the same data set. As shown in Table 12, the conclusion that can reasonably be drawn from this analysis is that the addition of project traffic will result in little, if any, change in operating conditions along Mendocino Avenue.

Table 12 – Existing and Existing plus Project PM Peak Hour Average Travel Speed on Mendocino Avenue

Existing Conditions				Existing plus Project			
Northbound		Southbound		Northbound		Southbound	
Speed	LOS	Speed	LOS	Speed	LOS	Speed	LOS
19	D	18	D	19	D	19	D

Notes: Speed is reported in miles per hour (mph)

Finding – The project is expected to have a less-than-significant impact on arterial traffic operation.

Future plus Project Conditions

Intersection Operation

Upon the addition of project-generated traffic to the anticipated Future volumes, the study intersections are expected to continue operating acceptably. These results are summarized in Table 13.

Table 13 – Future and Future plus Project Peak Hour Intersection Levels of Service

Study Intersection Approach	Future Conditions				Future plus Project			
	Weekday PM Peak		Saturday Peak		Weekday PM Peak		Saturday Peak	
	Delay	LOS	Delay	LOS	Delay	LOS	Delay	LOS
1. Round Barn Blvd/Round Barn Cir <i>Eastbound (Round Barn) Approach</i>	4.9	A	2.3	A	5.6	A	5.3	A
	10.5	B	8.5	A	11.1	B	8.8	B
2. Cleveland Ave/Industrial Dr	41.4	D	35.7	D	43.4	D	38.7	D
3. Mendocino Ave/US 101 North Ramps	25.9	C	23.0	C	25.9	C	23.0	C
4. Mendocino Ave/Fountaingrove Pkwy	135.8	F	43.4	D	142.7	F	48.3	D
5. Round Barn Blvd/Fountaingrove Pkwy (lower)	35.0	D	9.8	A	41.1	D	10.8	B
6. RoundBarn Blvd/Fountaingrove Pkwy (upper)	8.5	A	1.2	A	8.5	A	1.4	A

Notes: Delay is measured in average seconds per vehicle; LOS = Level of Service; Results for minor approaches to two-way stop-controlled intersections are indicated in *italics*; **Bold** text indicates unacceptable operation

Finding – The study intersections are expected to continue operating at the same Levels of Service with project traffic added to Future volumes as without it.

Arterial Operation

Upon adding project-generated trips to Mendocino Avenue, speeds are expected to remain virtually constant, though a 1-mph increase (or improvement) is projected in the northbound direction. As previously noted, this occurs due to the random seeding of vehicles for micro-simulation. As shown in Table 14, the arterial is operating acceptably during both peak periods; therefore, operation is considered acceptable.

Table 14 – Future and Future plus Project PM Peak Hour Average Travel Speed on Mendocino Avenue

Future Conditions				Future plus Project			
Northbound		Southbound		Northbound		Southbound	
Speed	LOS	Speed	LOS	Speed	LOS	Speed	LOS
17	D	20	D	18	D	19	D

Notes: Speed is reported in miles per hour (mph)

Finding – The project is expected to have a less-than-significant impact at Mendocino Avenue/Fountaingrove Parkway because the arterial segment is projected to continue operating acceptably upon adding project-generated traffic.

Alternative Modes

Pedestrian Facilities

Sidewalks exist along the east side of the project site on Round Barn Circle. The proposed site plans include sidewalk along the project frontage as well as connections between the site and sidewalks on Round Barn Circle.

Finding – Pedestrian facilities serving the project site will be adequate upon completion of the sidewalk proposed as part of the project.

Bicycle Facilities

Existing bicycle facilities, including a bike path on Fountaingrove Parkway and bike lanes on Mendocino Avenue, provide adequate access for bicyclists.

Bicycle Storage

Existing and planned bicycle facilities, per the City's *Bicycle and Pedestrian Master Plan*, would provide adequate access for bicyclists. However, the proposed site plan does not include bicycle parking at the hotel. While the majority of hotel guests are expected to travel by vehicle, some employees may wish to travel to and from the hotel by bike. According to the City of Santa Rosa's municipal code, Chapter 20.36.040, hotel land uses are required to provide one bicycle parking space plus one space per ten guest rooms. Based on City requirements, with plans for 114 rooms, the hotel would be required to provide 12 bicycle parking spaces.

Finding – Bicycle facilities serving the project site are adequate. However, there is no planned bicycle parking and provision of bicycles on-site for use by guests would further promote use of this mode of transportation.

Recommendation – To meet City requirements, 12 bicycle parking spaces should be provided on-site.

Transit

Existing transit routes are adequate to accommodate project-generated transit trips. Existing stops are within acceptable walking distance of the site.

Finding – Transit facilities serving the project site are adequate.

Parking

The project was analyzed to determine whether the proposed parking supply would be sufficient for the anticipated parking demand. The project site as proposed would provide a total of 116 parking spaces.

Required Parking

City parking supply requirements are based on the City of Santa Rosa's Municipal Code, Chapter 20-36; Parking and Loading Standards. Based on the City's standard of one space per guest room, the proposed project would be required to provide 114 parking spaces. With a planned supply of 116 parking spaces, parking would meet the City's requirements.

Conclusions and Recommendations

Conclusions

- The proposed hotel would be expected to generate an average of 931 daily trips with 68 trips during the weekday p.m. peak hour and 99 trips during the weekend p.m. peak hour.
- Five of the six study intersections are currently operating acceptably at LOS D or better and are expected to continue doing so under all volume scenarios evaluated with one exception. The intersection of Mendocino Avenue/Fountaingrove Parkway is currently operating at LOS E during the p.m. peak hour and is expected to drop to LOS F operation under Future volumes.
- An arterial analysis indicates that the Mendocino Avenue corridor is operating at LOS D during the p.m. peak hour under current volumes and is expected to do so under future volumes and upon adding project-generated trips. The project's impact is therefore less-than-significant.
- Pedestrian, bicycle, and transit facilities are generally adequate to serve the project site. However, the site plan does not include plans for bicycle parking.
- The proposed parking supply for the hotel of 116 spaces meets the City's parking requirement of one space per room.

Recommendations

- Secure parking for a minimum of twelve bicycles should be provided on-site.
